Kanban board

Name: Nikita Mankani
SRN: PES1UG24CS300
Section: E
Problem Statement: #54 - Local Sports Tournament & Bracket Manager

1. Board Creation

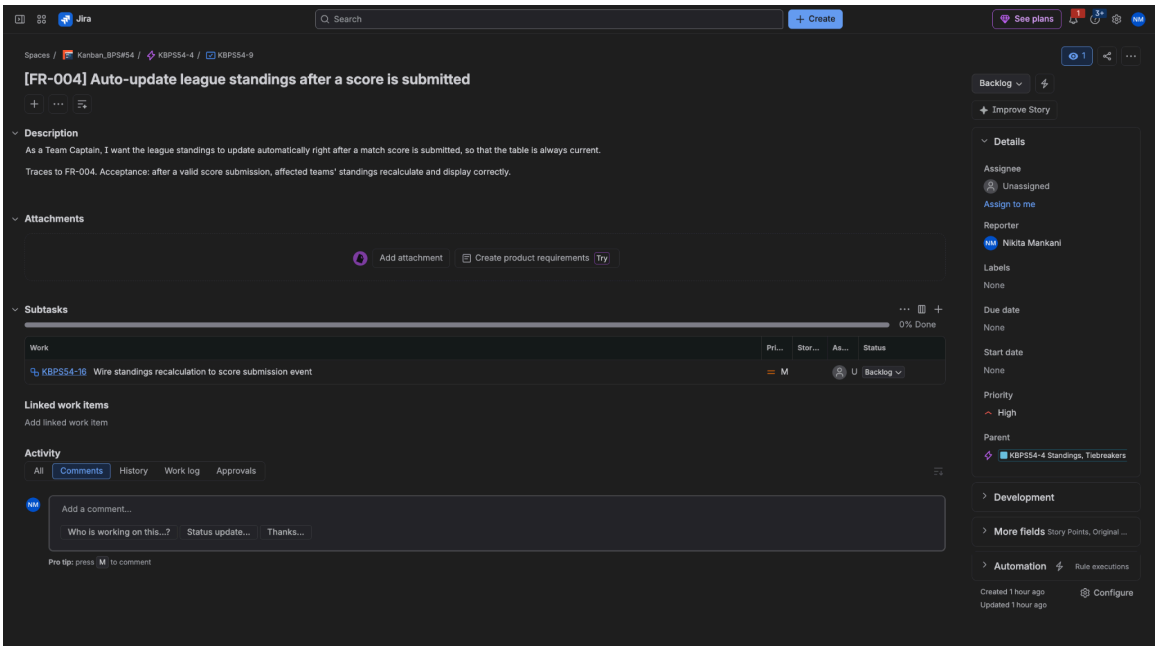

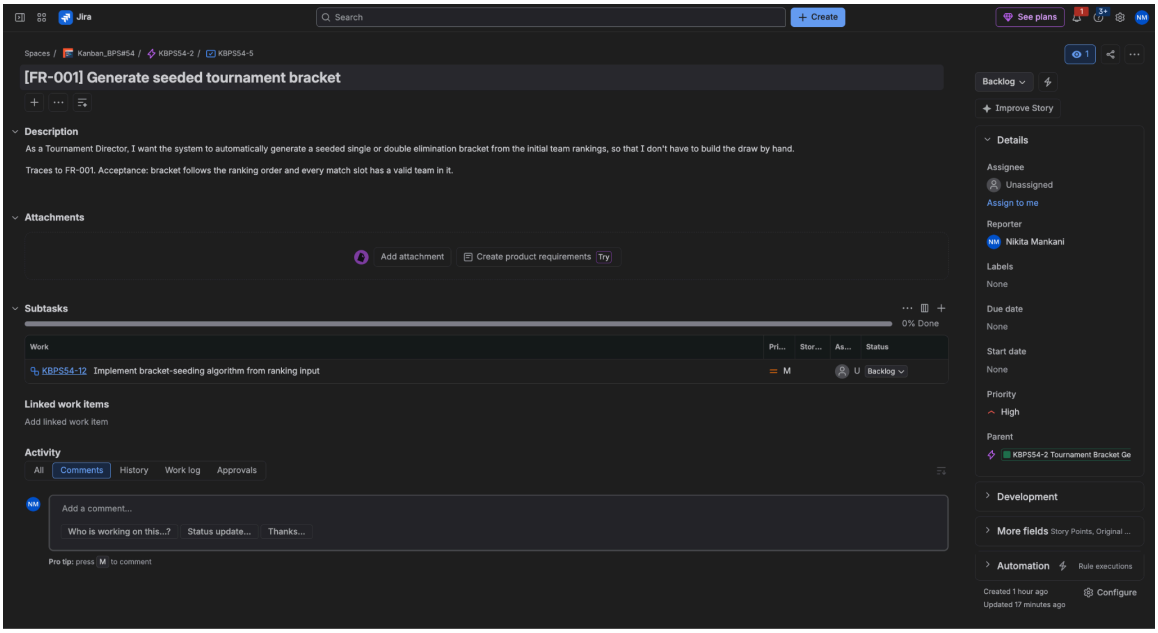

This board shows the KBPS54 backlog with all 7 requirement stories from my Lab 1 requirements table for Problem Statement 54 - 5 functional requirements and 2 non-functional requirements, each converted into a story. Each story title starts with its requirement ID (like [FR-001], [NFR-002]) so it maps directly back to the original table.

2. Epics

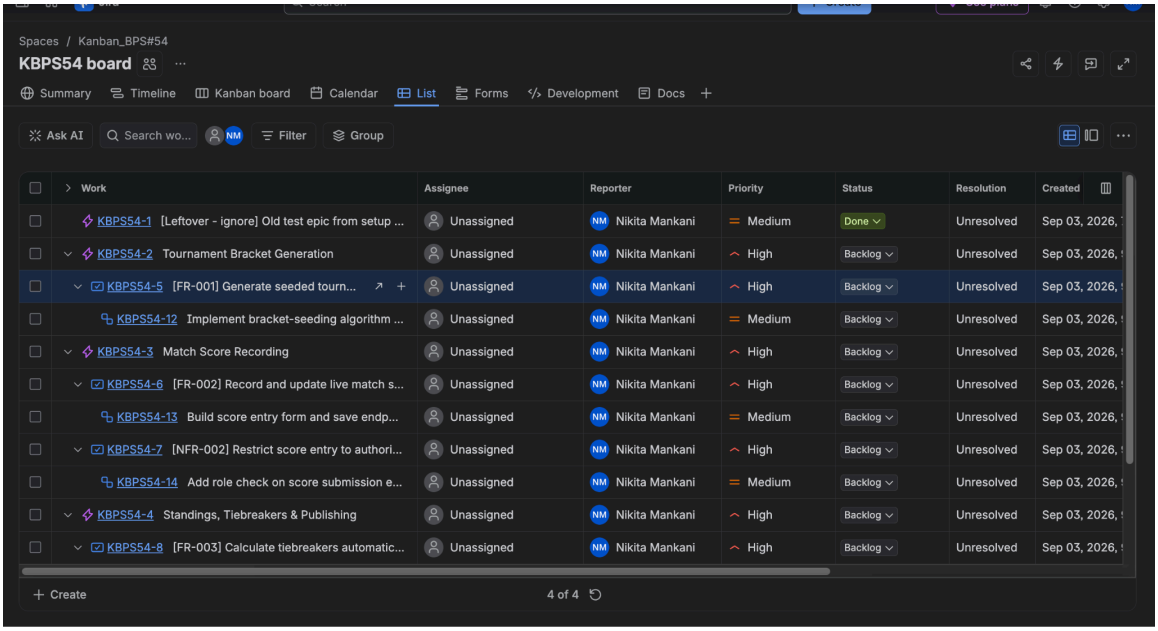

I grouped the 7 requirements into 3 epics based on what part of the system they belong to: Tournament Bracket Generation (FR-001), Match Score Recording (FR-002 and NFR-002), and Standings, Tiebreakers & Publishing (FR-003, FR-004, FR-005 and NFR-001). Each story is linked to its epic as a parent so the backlog stays organised by feature area, not just a flat list.

3. User Stories, Tasks and Sub-tasks

Every one of the 7 stories has a sub-task under it that breaks the story into one concrete implementation step, for example the bracket-generation story has a sub-task for implementing the seeding algorithm. I didn't go overboard with sub-tasks per story since the lab only needed enough to show the breakdown, not a full technical spec.

4. Board in progress (not an empty backlog)

All 7 stories and their sub-tasks are sitting in Backlog, unstarted. I kept this project's board untouched on purpose — Kanban here is about showing the board and backlog structure itself, not simulating a run-through. That's what the Scrum project does instead, with its two sprints.
